We use regression when we have a continuous outcome or dependent variable, and a set of independent variables which can be of different types.

Run a regression to test the hypothesis that as number of hospitals, number of hospital beds and total_population increases, covid deaths increase and as mask score increases covid deaths decrease.

```
hypo1 = formula(Deaths_COVID~
Number_of_hospitals+Number_of_beds+mask_score+total_population)
gauss1=glm(hypo1,
           data = fromPy,
           family = 'gaussian')
summary(gauss1)

##
